

Amendment to the Claims:

This listing of claims will replace all prior versions, and listings, of claim in the application:

Listing of Claims:

1. – 4. (Cancelled)

5. (Currently Amended) A washing machine, comprising:

a cabinet;

a tub provided in the cabinet;

a drum rotatably installed in the tub ;

a control panel coupled to the cabinet, wherein the control panel
forms a receiving space with a top plate of the cabinet;

a filter case configured to receive a noise filter therein and to be installed in the
receiving space; and

a filter case coupling assembly configured to slidably couple the filter case to the
receiving space provided on the top panel of the cabinet.

6-7. (Cancelled)

8. (Previously Presented) The washing machine as claimed in claim 5, wherein the filter case coupling assembly comprises:

a pair of coupling protrusions protruding in a lateral direction from opposite lower side edges of the filter case; and

a corresponding pair of guide rails provided on an upper surface of the top plate, wherein the pair of coupling protrusions are configured to be slidably inserted into the pair of guide rails so as to slidably couple the filter case to the top plate.

9. (Previously Presented) The washing machine as claimed in claim 5, wherein the filter case coupling assembly comprises:

at least one coupling protrusion protruding from a bottom portion of the filter case; and

at least one corresponding guide rail provided on an upper surface of the top plate, wherein the at least one coupling protrusion is configured to be slidably inserted into the at least one guide rail so as to slidably couple the filter case to the top plate.

10. (Previously Presented) The washing machine as claimed in claim 9, wherein the coupling protrusion comprises:

a body portion that extends downward from the bottom portion of the filter case; and

a pair of guide protrusions extending outward in a lateral direction from opposite lower side edges of the body portion.

11. (Previously Presented) The washing machine as claimed in claim 8, wherein a forward end of each guide rail is blocked so as to restrict forward movement of the coupling protrusion inserted therein.

12. (Previously Presented) The washing machine as claimed in claim 9, wherein a forward end of the at least one guide rail is blocked so as to restrict forward movement of the at least one coupling protrusion inserted therein.

13. (Previously Presented) The washing machine as claimed in claim 5, wherein the control panel is coupled to a rear portion of an upper surface of the top plate.

14. (Cancelled)

15. (Previously Presented) The washing machine as claimed in claim 5, further comprising a control unit installed in the receiving space and configured to control operation of the washing machine.

16. (Previously Presented) The washing machine as claimed in claim 15, wherein the noise filter is configured to prevent interference or attenuation of signals carried on wires leading to and from the control unit.

17. (Previously Presented) The washing machine as claimed in claim 5, further comprising:

a coupling boss extending rearwards from an upper surface of the filter case; and
a back panel configured to be coupled to a rear portion of the control panel so as to enclose the receiving space formed by the control panel and the top plate of the cabinet, wherein the back panel includes a coupling hole configured to receive the coupling boss when the filter case is coupled to the top plate and the back panel is coupled to the control panel.

18. (Previously Presented) The washing machine as claimed in claim 10, wherein the pair of guide protrusions are configured to be slidably inserted into the at least one guide rail.

19. (Previously Presented) A washing machine, comprising:

a cabinet;

a tub provided in the cabinet;

a drum rotatably coupled to the tub;

a control panel coupled to the cabinet so as to form a receiving space with the cabinet;

a filter case configured to be installed in the receiving space, wherein the filter case comprises at least one coupling protrusion extending outward from and laterally along an outer surface of the filter case; and

a coupling assembly comprising at least one guide rail provided on a surface of the cabinet and configured to slidably receive the at least one coupling protrusion to thereby mount the filter case in the receiving space.

20. (Previously Presented) The washing machine as claimed in claim 19, wherein the at least one coupling protrusion extends outward from and laterally along a bottom surface of the filter case, and the at least one guide rail is provided at a corresponding position on a top plate of the cabinet.

21. (Previously Presented) The washing machine as claimed in claim 20, wherein the at least one coupling protrusion comprises a pair of coupling protrusions extending outward from and laterally along opposite bottom side edges of the filter case.

22. (Previously Presented) The washing machine as claimed in claim 20, wherein the at least one coupling protrusion comprises:

a body portion that extends outward from a central portion of a bottom surface of the filter case; and

a pair of guide protrusions extending outward from and laterally along opposite bottom side edges of the body.

23. (Previously Presented) The washing machine as claimed in claim 19, wherein a forward end of the at least one guide rail is blocked so as to restrict forward movement of the at least one coupling protrusion inserted therein.

24. (Previously Presented) The washing machine as claimed in claim 19, further comprising a control unit installed in the receiving space and configured to control operation of the washing machine, and a noise filter provided in the filter case and configured to prevent interference or attenuation of signals carried on wires leading to and from the control unit.

25. (Previously Presented) The washing machine as claimed in claim 19, further comprising:

a coupling boss extending rearwards from an upper surface of the filter case; and

a back panel configured to be coupled to a rear portion of the control panel so as to enclose the receiving space formed by the control panel and the cabinet, wherein the back
